Lubrication System Design & Solutions

Lubrication is the most important component of any machine. Getting it right is utmost important. To achieve optimum efficiency your machine will need the right lubricant, the right quantity, the right frequency at the right place.

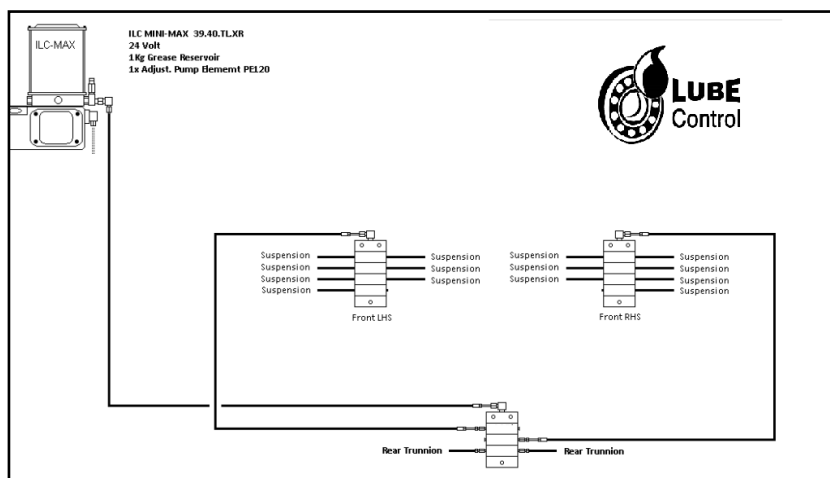

A centralised lubrication system commonly called an "auto lube system" will lubricate all your frictional points from a single pump. Using an auto lube system can be the most effective and efficient way to lubricate any machine, but all too often an incorrect lube system, an incorrect design or an incorrect installation can cause major issues.

At Lube Control we pride ourselves of "getting it right the first time". Our engineers have had extensive experience with all equipment. Ranging from small industrial pumps to road trains and from crushers to largest of earthmoving machinery.

Lube Control can design auto lube systems to suit your machine, weather you are an owner operator, a plant maintenance engineer or an OEM. Our design services can be used in the following industries:

- Agriculture
- Construction
- Mining
- Transport
- Wind
- Industry
- Food
- Printing

Whether you are lubricating one point or hundreds of points, bearings, bushes, gears or chains - we'll design the correct system for you, and if needed we'll install and commission the system too. Get in touch with us today to discuss your lubrication system design.
